Object name: Sands Model 004 Calculator

Vintage: c.1974

Synopsis: Early simple electronic calculator with LED display. S/N: ???.

Description:

The Sands Model 004 Calculator is an early electronic calculator made in Hong Kong, typical of those that began the market for inexpensive simple electronic calculators after the introduction of calculator and microprocessor chips and LED displays.

The Model 004 had an 8-digit LED display, measured 113 x 63 x 25mm, and was powered by a 9V 006P battery or an AC adapter. It had just the four basic arithmetic functions. It has been suggested that it used a microprocessor from General Instruments.

The Model 004 in this collection includes the original carrying case, Owner's Manual and Quick Reference Guide, but does not include the AC adapter.
