Accession Date: 13-Feb-2015

Accession By: Maire Jones, Prof.Doug Leith

Object name: Apple Macintosh SE/30

Vintage: c.1989

Synopsis: Two 5th-generation all-in-one Macs, one in its backpack. SE/30(1) S/N:

???, SE/30(2) S/N: CK049004KA1.

Description:

Apple introduced the Macintosh SE/30 in 1989 as a redesign of the Macintosh IIx into the form factor of a Macintosh SE, thereby significantly upgrading the performance and memory capacity of the line of successful all-in-one integrated desktop Macs.

It included a Motorola 16MHz MC68030 CPU and MC68882 FPU, up to 128MB of 120ns 30-pin SIMM memory, a 1.44MB floppy disk drive, and a 40 or 80MB hard disk. It was very popular with users.

A standard SE/30 could run Apple's standard operating systems up to System 7.5.5, and also A/UX, Apple's early UNIX operating system.

For those that needed portability, the all-in-one Macs were a lighter alternative to the luggable PCs. Either could be purchased with a light carrying case or backpack. One SE/30 in this collection is in its backpack.
