Introduction

This list is an attempt to coalesce all net knowledge on PDP-11 UNIBUS and Qbus modules. It is designed to supercede all the various homespun lists floating around -- giving one solid source of information.

An expansion is in progress. In addition to PDP-11 UNIBUS and Qbus, the list will now cover other forms of the PDP-11 such as the Professional Series (CTI-Bus). Further, it will cover not only PDP-11s, but VAXen and MIPS systems as well (VAXen being available in both UNIBUS and Qbus forms, and MIPS machines in Qbus). The list will also begin to include chassis, mounting boxes, power supplies and backplanes.

For some non-Digital (third-party) disk and tape controllers, a list of reputedly compatible drives may be shown. This list is not exhaustive, and other similar disk and tape interfaces may also work.

This list may be found on the following sites:

- 1) <http://world.std.com/~mbg/pdp11-field-guide.txt>

As of 02-Feb-2000, when I accepted the offer from the former maintainer to take over the file, this copy has become the official, most up-to-date copy. One thing people may note is that I have renamed it. This is because there is a similar file in the works elsewhere to cover pdp8 modules and options.

Comments and suggestions about the format and content of the file will be welcome at all times.

Please note that it may take some time for the *new* official file to make it to the mirrors mentioned below.

- 2) On metalab.unc.edu, in the following location:
</pub/academic/computer-science/history/pdp-11/hardware/field-guide.txt>

Tim maintains quite a large archive of other information, it is most definitely worth checking out -- Thanks, Tim!

- 3) On <ftp.village.org>, in /pub/pdp-11/field-guide.txt

Dworkin keeps a compressed version here, too.

- 4) On <ftp.update.uu.se> in /pub/pdp11/doc/field-guide.txt

Johnny's site has quite a plethora of PDP-11 stuff, along with files/software pertaining to Pros and DECmates.

This file will be posted on an irregular basis to the PDP-11 related newsgroups (vmsnet.pdp-11, alt.sys.pdp11).

In order to ensure that this file is as comprehensive and accurate as possible, please don't hesitate to:

- 1) Send any additions or corrections you may have to the file maintainer (currently mbg@world.std.com).
- 2) Feel free to edit a private copy of the file to include your additions or corrections and send it (or a differences file) to the file maintainer.

Please be prepared to cite the source of any such information. This is to ensure that the file contains only validated information.

Just make sure you send anything you have to me. If you have relevant hardcopy and you don't feel like typing it in, get in contact with me and we'll work something out.

We owe a great amount of thanks to Tim Shoppa, Johnny Billquist, Dworkin Muller and all others who maintain PDP-11 ftp sites. Also, a great deal of respect is to be accorded to *anyone* attempting to hook a PDP-11 to the net, or running one currently connected, for that matter. The same for anyone, anywhere who *doesn't* put a PDP-11 into the dumpster. Or the smelter. Etc. If you don't know what to do with it, please contact me via email and we'll get the information out to people who would be interested in saving it.

We owe final credit and gratitude to Ronald Copley, who developed and maintained this list for numerous years. Thanks *alot*!

Notes:

- o 'Refs:' indicates documentation in which information for the option may be found.
- o In the BUS column, Q is Qbus, U is UNIBUS, CTI is CTI bus (Professional 300 series). With Vax and MIPS boards being added, there may be some new bus designations such as BI and XMI added here.
- o EK-xxxxx-yy numbers are documents, with yy = UG for user guide, TM for technical manual, IN for installation manual, RC for reference card, OP for operator's manual, PS for pocket service guide, CG for configuration Guide. (These are only a few examples, not a definitive list). The 'xxxx' is often, but not always, the option name.
- o MP-xxxxx numbers are maintenance printsets
- o ZFxxx-RZ and ZJxxx-RZ numbers are Diagnostic Documentation Kits.
- o The Micronotes (uNotes) are single-topic articles, written by various people within Digital to clarify information for other Digital employees. There are two sets of them, with similar numbers. If a uNOTE is cited here, it should be listed as either uNOTE O# to signify the original set of 115, or uNOTE N# to signify the newer set of 44. Some of the older uNotes were recycled and given new numbers. Check out metalab.unc.edu for copies of the new Micronotes, which can be found under:

</pub/academic/computer-science/history/pdp-11/hardware/micronotes>

- o For Qbus boards, unless specified as having an S-Box handle or being a MINC module or for a BA200 series enclosure, boards should be able to be used in any Qbus backplane. (In fact, most boards without S-Box handles should still be usable in a BA200 series enclosure)
- o Please note that some Qbus modules may only be inserted into Q/Q backplanes, some may only be inserted into Q/CD backplanes, and some are jumper selectable for Q/Q or Q/CD. Also, some modules support 16-bit only, some support 18-bit and some support full 22-bit.
- o The latest version of the file has been modified such that for a given module, all lines containing text pertaining to that module have the module number at the beginning of the line. This is to make it easy to grep (UNIX) for a module number and have all information returned instead of just the first line.
